U.S. FISH AND WILDLIFE SERVICE SPECIES ASSESSMENT AND LISTING PRIORITY ASSIGNMENT FORM

SCIENTIFIC NAME: Cyanea lanceolata
COMMON NAME: Haha
LEAD REGION: Region 1
INFORMATION CURRENT AS OF: July 2005
STATUS/ACTION:
 Species assessment - determined species did not meet the definition of endangered or threatened under the Act and, therefore, was not elevated to Candidate status New candidate Continuing candidate
_X Continuing candidate Non-petitioned
X Petitioned - Date petition received: May 11, 2004 90-day positive - FR date:
 X 12-month warranted but precluded - FR date: May 11, 2005 N Did the petition request a reclassification of a listed species? FOR PETITIONED CANDIDATE SPECIES:
a. Is listing warranted (if yes, see summary of threats below)? <u>yes</u>b. To date, has publication of a proposal to list been precluded by other higher priority listing actions? <u>yes</u>
c. If the answer to a. and b. is "yes", provide an explanation of why the action is
precluded. We find that the immediate issuance of a proposed rule and timely promulgation of a final rule for this species has been, for the preceding 12 months, and continues to be, precluded by higher priority listing actions. During the past 12 months, most of our national listing budget has been consumed by work on various listing actions to comply with court orders and court-approved settlement agreements, meeting statutory
deadlines for petition findings or listing determinations, emergency listing evaluations and determinations and essential litigation-related, administrative, and program management tasks. We will continue to monitor the status of this species as new information becomes available. This review will determine if a change in status is
warranted, including the need to make prompt use of emergency listing procedures. For information on listing actions taken over the past 12 months, see the discussion of "Progress on Revising the Lists," in the current CNOR which can be viewed on our
Internet website (http://endangered.fws.gov).
Listing priority change
Former LP:
New LP:
Date when the species first became a Candidate (as currently defined): 2002
Candidate removal: Former LP: A – Taxon is more abundant or widespread than previously believed or not subject to

the degree of threats sufficient to warrant issuance of a proposed listing or
continuance of candidate status.
U – Taxon not subject to the degree of threats sufficient to warrant issuance of a proposed listing or continuance of candidate status due, in part or totally, to conservation efforts that remove or reduce the threats to the species.
F – Range is no longer a U.S. territory.
I – Insufficient information exists on biological vulnerability and threats to support listing.
M – Taxon mistakenly included in past notice of review.
N – Taxon does not meet the Act's definition of "species."
X – Taxon believed to be extinct.

ANIMAL/PLANT GROUP AND FAMILY: Flowering plants, Campanulaceae (Bellflower family)

HISTORICAL STATES/TERRITORIES/COUNTRIES OF OCCURRENCE: Hawaii, island of Oahu

CURRENT STATES/ COUNTIES/TERRITORIES/COUNTRIES OF OCCURRENCE: Hawaii, island of Oahu

LAND OWNERSHIP: This species is known to occur on lands owned by the State of Hawaii and private citizens.

LEAD REGION CONTACT: Paul Phifer, 503-872-2823, paul_phifer@fws.gov

LEAD FIELD OFFICE CONTACT: Pacific Islands Fish and Wildlife Office, Christa Russell, 808-792-9400, christa_russell@fws.gov

BIOLOGICAL INFORMATION:

Species Description Cyanea lanceolata is a shrub with a woody stem 1 to 3 meters (m) (3.3 to 9.8 feet (ft)) long and sharp projections in juveniles becoming scabrous or smooth with age. Leaves are elliptic or oblanceolate, with blades 15 to 60 centimeters (cm) (6 to 24 inches (in)) long and 5.5 to 14 cm (2.2 to 5.5 in) wide, and a lower leaf surface pubescent with simple hairs or rarely glabrous. Inflorescences are 4 to 16-flowered, with peduncles 20 to 100 millimeters (mm) (0.8 to 4 in) long. The calyx lobes are triangular and 1 to 3 mm (0.04 to 0.12 in) long. The corolla is pale to dark magenta, often with lighter or darker longitudinal stripes. The hypanthium is glabrous. Berries are ovoid to obpyriform and 16 to 20 mm (0.6 to 0.8 in) long (Lamers 1999).

<u>Taxonomy</u> *Cyanea lanceolata* was described by Lammers, Givnish and Sytsma (Lammers 1999). This species is recognized as a distinct taxon in the supplement to the *Manual of the Flowering Plants of Hawaii* (2003), the most recently accepted Hawaiian plant taxonomy.

<u>Habitat</u> Cyanea lanceolata is found in Acacia koa-Metrosideros polymorpha lowland mesic

forest with the associated species *Cyanea angustifolia*, *Dicranopteris linearis*, *Syzygium sandwicensis*, and *Touchardia latifolia*, at elevations between 390 to 439 m (1,280 to 1,440 ft) (Hawaii Natural Heritage Program Database 2004).

<u>Historical and Current Range/Current Status</u> This species is known from 20 populations totaling less than 300 individuals on the island of Oahu. All species of *Rollandia* have been moved to *Cyanea*, without a change in taxonomic entity (Lammers *et al.* 1993; Lammers 1998). This species is now considered rare and threatened (Joel Lau, Hawaii Natural Heritage Program, pers. comm. 1996; John Obata, amateur botanist, pers. comm. 1996).

THREATS:

A. The present or threatened destruction, modification, or curtailment of its habitat or range. This species is threatened by feral pigs (Sus scrofa) that adversely modify habitat (J. Lau, pers. comm. 1996; J. Obata, pers. comm. 1996). As early as 1778, European explorers introduced livestock, which became feral, increased in number and range, and caused significant changes to the natural environment of Hawaii. Past and present activities of introduced alien mammals are the primary factor altering and degrading vegetation and habitats on Oahu. The pig is originally native to Europe, northern Africa, Asia Minor, and Asia. European pigs, introduced to Hawaii by Captain James Cook in 1778, became feral and invaded forested areas, especially wet and mesic forests and dry areas at high elevations. They are currently present on Oahu and four other islands, and inhabit rain forests and grasslands. While rooting in the ground in search of the invertebrates and plant material they eat, feral pigs disturb and destroy vegetative cover, trample plants and seedlings, and threaten forest regeneration by damaging seeds and seedlings. They disturb soil and cause erosion, especially on slopes. Alien plant seeds are dispersed on their hooves and coats as well as through their digestive tracts, and the disturbed soil is fertilized by their feces, helping these plants to establish. Pigs are a major vector in the spread of many introduced plant species (Smith 1985; Stone 1985; Medeiros et al. 1986; Scott et al. 1986; Tomich 1986; Cuddihy and Stone 1990; Wagner et al. 1999a). No known conservation measures have been implemented to date to address this threat.

B. Overutilization for commercial, recreational, scientific, or educational purposes. None known.

C. Disease or predation.

Pig damage to members of this species has been documented (J. Lau, pers. comm. 1996; J. Obata, pers. comm. 1996). No known conservation measures have been implemented to date to address this threat. Rats and slugs eat leaves and fruits of other members of this genus, and therefore are a potential threat to this species. Currently, there are no conservation measures being implemented for rats and slugs.

Of the four species of rodents that have been introduced to the Hawaiian Islands, the species with the greatest impact on the native flora and fauna is probably *Rattus rattus* (black or roof rat), which now occurs on all the main Hawaiian Islands. Black rats, and to a lesser extent *Mus musculus* (house mouse), *R. exulans* (Polynesian rat), and *R. norvegicus* (Norway rat), eat the fruits of some native plants, especially those with large, fleshy fruits. Many native Hawaiian

plants produce fruit over an extended period of time, thus producing a prolonged food supply for rodent populations. Black rats strip bark from some native plants, and eat the fleshy stems and fruits of plants in the bellflower and African violet families (Tomich 1986; Cuddihy and Stone 1990). Rat damage to the stems of species of *Cyanea* has been reported in the wet forests of Kauai (Loyal Mehrhoff, U.S. Fish and Wildlife Service (Service), pers. comm. 1994; S. Perlman, pers. comm. 1994).

Little is known about the predation of certain rare Hawaiian plants by slugs. Indiscriminate predation by slugs on plant parts of the related *Cyanea remyi* has been observed by field botanists (L. Mehrhoff, pers. comm. 1994; S. Perlman, pers. comm. 1994). The effect of slugs on the decline of this and related species is unclear, although slugs may pose a threat by feeding on the stems and fruit, thereby, reducing the vigor of the plants and limiting regeneration. Outplanted seedlings of the closely related genus *Clermontia* have been completely removed by slugs (Alvin Yoshinaga, University of Hawaii's Lyon Arboretum, pers. comm. 1995).

D. The inadequacy of existing regulatory mechanisms.

Pigs are managed in Hawaii as game animals but may populate inaccessible areas where hunting is difficult, if not impossible, and therefore has little effect on their numbers (Hawaii Heritage Program 1990). Pig hunting is allowed on all islands either year-round or during certain months, depending on the area (Hawaii Department of Land and Natural Resources n.d.-a, n.d.-b, n.d.-c). However, public hunting does not adequately control the number of ungulates to eliminate this threat to native plant species. No other known conservation measures have been implemented to date to address this threat.

E. Other natural or manmade factors affecting its continued existence. Alien plant species are a major threat to this subspecies (J. Lau, pers. comm. 1996; J. Obata, pers. comm. 1996).

The original native flora of Hawaii consisted of about 1,400 species, nearly 90 percent of which were endemic. Of the total native and naturalized Hawaiian flora of 1,817 taxa, 47 percent were introduced from other parts of the world, and nearly 100 species have become pests (Smith 1985; Wagner et al. 1999a). Several studies (Cuddihy and Stone 1990; Wood and Perlman 1997; Robichaux et al. 1998) indicate nonnative plant species may outcompete native plants similar to Cyanea lanceolata. Competition may be for space, light, water, or nutrients, or there may be a chemical inhibition of other plants (Smith 1985; Cuddihy and Stone 1990). In addition, nonnative pest plants found in habitat similar to that of this species have been shown to make the habitat less suitable for native species (Smathers and Gardner 1978; Smith 1985; Loope and Medeiros 1992; Medeiros et al. 1992; Ellshoff et al. 1995; Meyer and Florence 1996; Medeiros et al. 1997; Loope et al. 2004). In particular, alien pest plant species modify habitat by modifying availability of light, altering soil-water regimes, modifying nutrient cycling, or altering fire characteristics of native plant communities (Smith 1985; Cuddihy and Stone 1990; Vitousek et al. 1987). Because of demonstrated habitat modification and resource competition by nonnative plant species in habitat similar to habitat of Cyanea lanceolata, the Service believes nonnative plant species are a threat to Cyanea lanceolata. The remaining unmanaged populations of Cyanea lanceolata are still impacted by this threat.

CONSERVATION MEASURES PLANNED OR IMPLEMENTED None known.

SUMMARY OF THREATS

The major threats to this species include pigs and nonnative plant species, which are believed to be a major cause of the decline of this species throughout its range. Rats and slugs are also potential threats. No conservation efforts have been initiated to date.

LISTING PRIORITY

THREAT			
Magnitude	Immediacy	Taxonomy	Priority
High	Imminent Non-imminent	Monotypic genus Species Subspecies/population Monotypic genus Species Subspecies/population	1 2* 3 4 5 6
Moderate to Low	Imminent Non-imminent	Monotypic genus Species Subspecies/population Monotypic genus Species Subspecies/population	7 8 9 10 11 12

Rationale for listing priority number:

Magnitude:

This species is highly threatened by pigs, that prey upon it, degrade and destroy habitat, and by nonnative plants that outcompete and displace it. Potential threats to this species include rats and slugs that may directly prey upon individuals. These threats to the lowland mesic forest habitat of *Cyanea lanceolata* and individuals of this species occur throughout its range, and are expected to continue or increase without their control or eradication. No conservation efforts have been initiated to date.

Imminence:

Threats to *Cyanea lanceolata* from pigs and nonnative plants are imminent because they are ongoing.

Yes Have you promptly reviewed all of the information received regarding the species for the purpose of determining whether emergency listing is needed?

Is Emergency Listing Warranted? No. The species does not appear to be appropriate for emergency listing at this time because the immediacy of the threats is not so great as to imperil a significant proportion of the taxon within the time frame of the routine listing process. *Cyanea lanceolata* is currently known from 20 populations totaling less than 300 individuals. This species is primarily threatened by feral pigs and nonnative plants. If it becomes apparent that the routine listing process is not sufficient to prevent large losses that may result in this species' extinction, then the emergency rule process for this species will be initiated. We will continue to monitor the status of *Cyanea lanceolata* as new information becomes available. This review will determine if a change in status is warranted, including the need to make prompt use of emergency listing procedures.

DESCRIPTION OF MONITORING:

Much of the information in this form is based on the results of a meeting of 20 botanical experts held by the Center for Plant Conservation in December of 1995, and was updated by personal communication with John Obata, amateur botanist, in 1996; Steve Perlman, National Tropical Botanical Garden, in 1994; Joel Lau, Hawaii Natural Heritage Program, in 1996; Loyal Mehrhoff, Service, in 1994; and Alvin Yoshinaga, Lyon Arboretum, in 1995. We have incorporated additional information on this species from our files and the most recent supplement to the *Manual of the Flowering Plants of Hawaii* (Wagner and Herbst 2003). In 2004, the Pacific Islands office contacted the following species experts: Bob Hobdy, retired from Hawaii Division of Forestry and Wildlife; Joel Lau, Hawaii Natural Heritage Program; Art Medeiros, U.S.G.S. Biological Resources Discipline; Hank Oppenheimer, resource manager for Maui Land and Pineapple Company; and Steve Perlman and Ken Wood, National Tropical Botanical Garden. New information was provided by Steve Perlman and Ken Wood in 2004. In 2005 we contacted the species experts listed below, but received no new information.

The Hawaii Natural Heritage Program identified this species as critically imperiled (Hawaii Natural Heritage Program Database 2004). Based on the International Union for Conservation of Nature and Natural Resources Red Plant Data Book rarity categories, this species is recognized as Rare (could be at risk) by Wagner *et al.* (1999b).

Species experts were contacted but did not provide new information this year, no new literature was found, and no known entities are studying this species. However, it is highly likely that the previously reported threats continue to impact the species at the same or an increased level.

COORDINATION WITH STATES:

In October 2004 we provided the Hawaii Division of Forestry and Wildlife with copies of our most recent candidate assessments for their review and comment. Vickie Caraway, the State botanist, reviewed the information for this species and provided no additional information or corrections (V. Caraway, pers. comm. 2005).

APPROVAL/CONCURRENCE: Lead Regions must obtain written concurrence from all other Regions within the range of the species before recommending changes to the candidate list, including listing priority changes; the Regional Director must approve all such recommendations. The Director must concur on all 12-month petition findings, additions of species to the candidate list, removal of candidate species, and listing priority changes.
